

Release notes for August 2018

The Summer 2018 release of Enterprise Vault.cloud will be rolled out across Veritas' global data centers during August 2018, during regularly-planned maintenance windows. Customers will be notified in advance that the service will not be available during this time.

You can do the following with the Summer 2018 release:

- **Address global privacy concerns with Veritas Information Classifier**
Enterprise Vault.cloud now integrates with the Veritas Information Classifier. It allows you to automatically classify items based on their content and metadata. Using Enterprise Vault.cloud Discovery Archive, you can search for and filter items according to the tags that the Veritas Information Classifier has assigned to them. With support for more than 70 default policies, you can address a wide variety of compliance regulations, including HIPAA, GDPR (with support for all EU member states), Sarbanes-Oxley, and many more. Classification is an upgrade option for Enterprise Vault.cloud. It will not show in your administration console unless you have requested a trial or purchased licenses for it.
- **Set up alerts to continuously monitor your usage counts**
Enterprise Vault.cloud offers you the flexibility to add users as needed, even if you have to go above your current licensed amount. Now, in just a matter of seconds, you can enable usage alert notifications, which will automatically send an email to you when you reach your specified user threshold. You have the ability to set the notification frequency and also add up to 50 email addresses in the notification pane. We strongly encourage you to enable this helpful alert functionality to ensure you are always aware of your user counts, even when you aren't logged in to your Administration console. For more information, please review the following TechNote.

- **Archive larger messages**
With so many customers now using Microsoft Office 365 as email platform of choice, it is critical for your archive to support the same message size as Office 365. This release delivers support for messages up to 200MB (above Office 365's current 150MB limit) in Enterprise Vault.cloud. This functionality is available to all customers, regardless of mail platform.

- **Use Centrify SSO**
Enterprise Vault.cloud now supports Centrify SSO, giving you even greater flexibility to use the SSO tool of your choice.
